

Made It

From IRCTC and Tirupati to FASTag, dedicated agents for the services that matter most.

Microsoft Hackathon 2026

Problem Statement

Digital India connected 1.4B citizens — every portal still expects you to be your own IT support

12+

Fragmented gov portals

8-15

Clicks per single task

3×

CAPTCHA / OTP gates

Portal maze

IRCTC, Passport Seva, TNEB, India Post — unique UI, language and payment flows. No shared login or session memory.

High-friction workflows

Users repeat 8-15 click sequences per task — OTP, CAPTCHA and re-entry; one error resets the entire session.

Brittle RPA breaks

Traditional bots fail when CSS selectors or layouts change; they cannot reason about redesigned portal pages.

Blind automation is unsafe

Aadhaar, UPI and OTP are legal trust boundaries. Auto-submit bots create fraud and compliance risk.

Our Goal

- One plain-English request → Made It completes IRCTC, India Post, TNEB and 12+ portals.
- You approve every OTP, CAPTCHA and payment — automation with trust, not blind bots.

Solution Overview

Agentic Web — describe the task, watch the agent execute

Natural Language

User types plain English. Agent opens Chrome and completes the workflow step-by-step.

Dual Automation

AI mode: Claude Sonnet 4.6 adapts to any page. Scripted mode: zero API cost, production reliable.

Human-in-the-Loop

CAPTCHA, OTP, login, and payment always pause for user input in Streamlit prompt box.

12+ Integrations

IRCTC, RedBus, Flights, TTD, Passport, India Post, TNEB, FASTag, and exam portals.

Full Transparency

Every action shown as live step cards with screenshots, logs, and phase progress.

Key Insight

- Claude adapts when gov portals change layout; scripted flows run with zero API cost.
- Same Streamlit UI serves hackathon demos and real citizen workflows.

Architecture — Four Domains of AI

How Agentic Web maps to enterprise AI architecture patterns

Structured Data Extraction

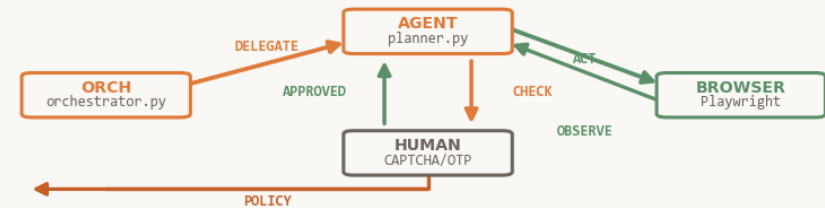

High Volume · Strict Schemas · Batch Pipelines

JSON output from India Post, TNEB bills, exam results

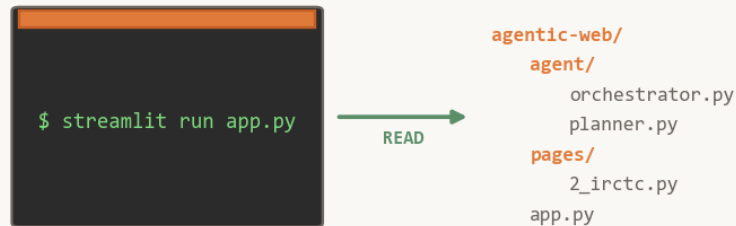

Customer Support Orchestration

Stateful · Human-in-the-Loop · Policy Constraints

Developer Productivity

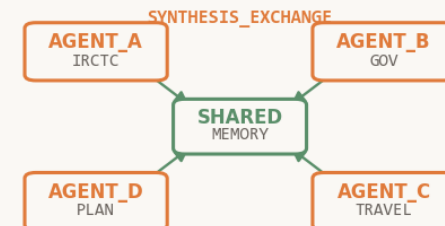

Dynamic Tasks · Iterative Context · Tool Use

CDP Inspector · live logs · step screenshots

Multi-Agent Systems

Parallel · Shared Memory · Cross-Agent Synthesis

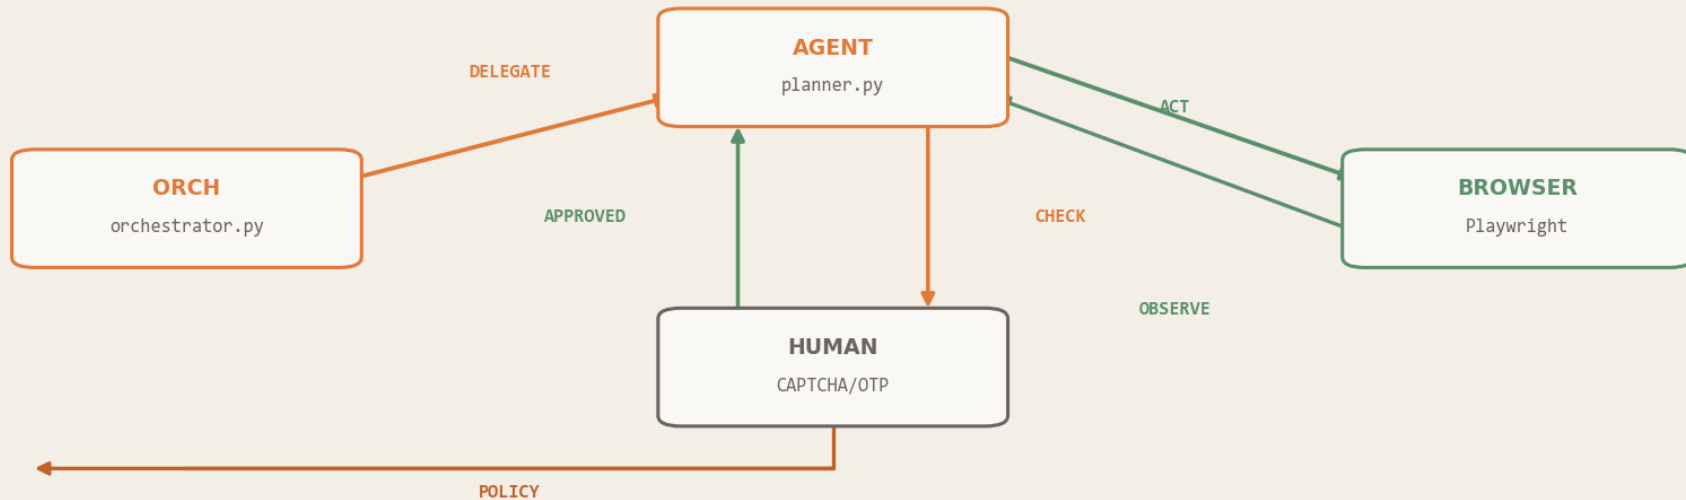

travel_runner · session_state · task_history

Architecture Insight

- Orchestrator delegates to AI; human gates block risky submits.
- Browser feedback re-plans — enterprise support at scale.

Core Architecture — Customer Support Orchestration

observe → plan → act → verify with mandatory human gates

Orchestrator

orchestrator.py runs
the loop, retries
failures, blocks

AI Agent

Claude reads
screenshot + DOM index
list, returns one JSON

Human Gate

ask_user for CAPTCHA
and OTP. confirm
before payment or

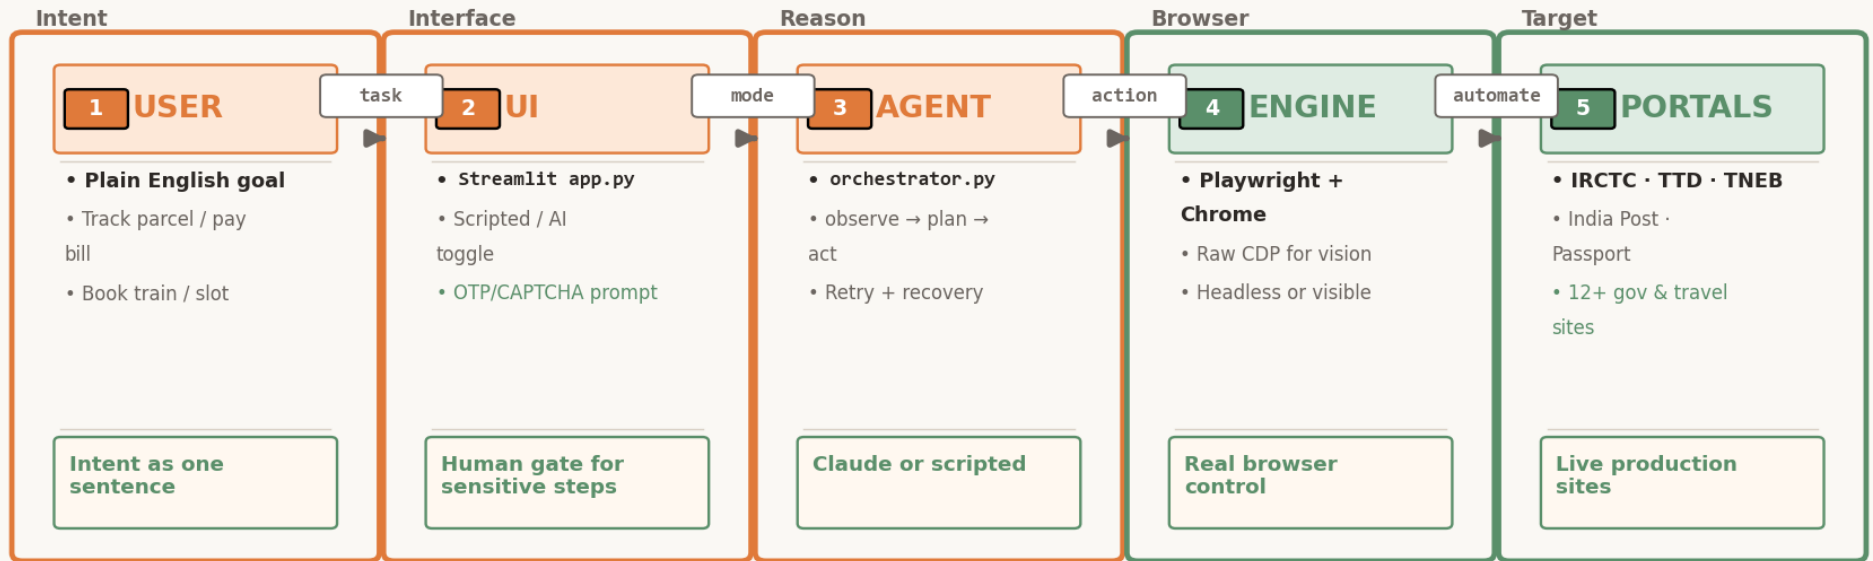

Browser

Playwright default.
Raw CDP for vision
clicks and network

End-to-End System Flow

Five-stage pipeline — natural language in, verified portal result out

REQUEST PIPELINE · 8-15 steps · 30-step cap · ~2 s/cycle

Data Flow

- In: task → UI → agent → browser → portal
- Out: step cards + screenshot → JSON result

Dual Mode

- AI: Claude adapts to any page
- Scripted: fixed steps, no API

Human-in-the-Loop

- OTP/CAPTCHA pause in Streamlit
- Never auto-submit payment data

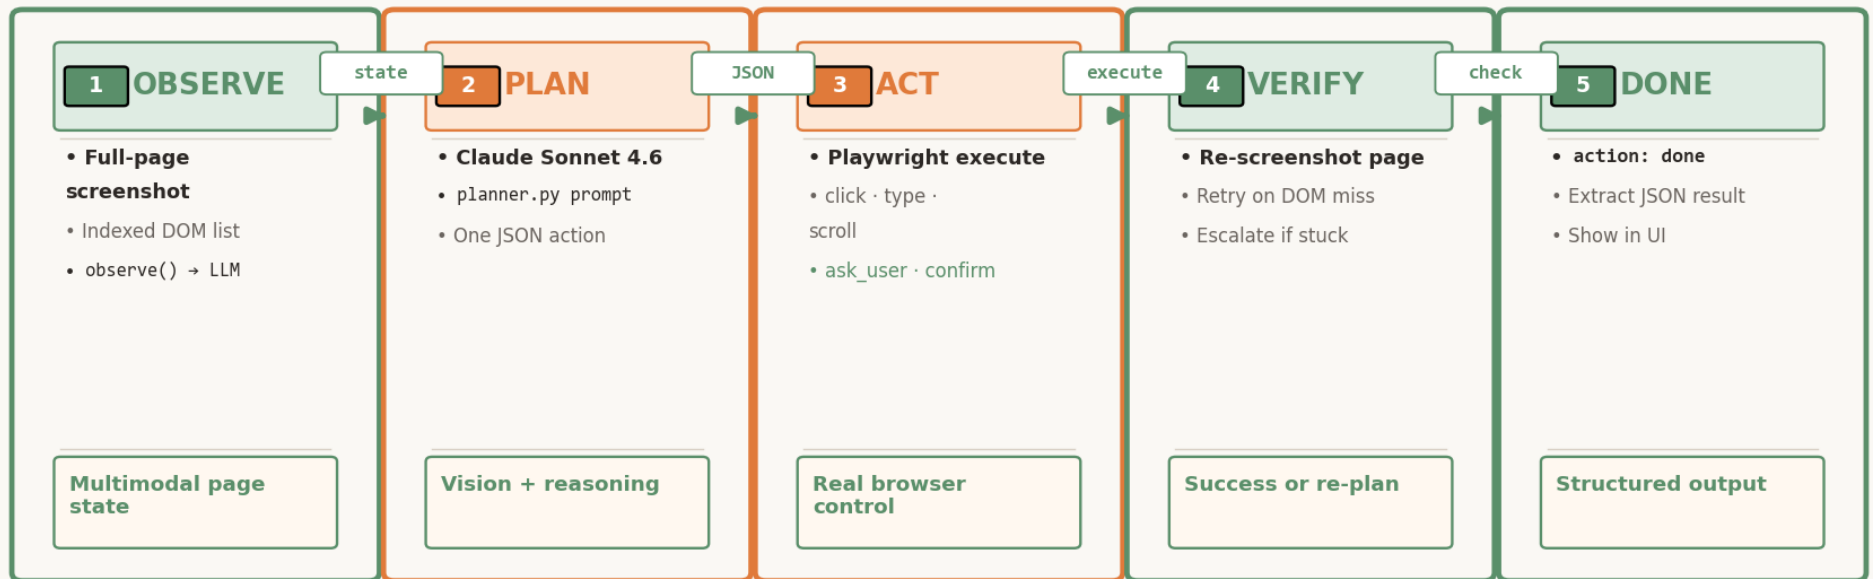

Transparency

- Live card + screenshot each step
- Full log, timing and status

AI Integration Details

Per-step observe-plan-act-verify cycle with structured JSON actions

AGENT STEP LOOP · 1 JSON action per LLM call · screenshot + DOM in

On failure → re-observe and re-plan (max 30 cycles)

Example JSON Actions (one per step)

LLM Stack

- Primary: Claude Sonnet 4.6
- OpenAI fallback · scripted mode

Action Schema

- `navigate · click · type · select`
- `scroll · wait · ask_user · done`

Safety Gates

- Payments need confirm
- CAPTCHA/OTP via `ask_user`

Live Demo — India Post Tracking

Scripted mode · no API key required

Step 1

navigate to `indiapost.gov.in`
Opens Track N Trace widget

SUCCESS

Step 2

type consignment number
Enters EK403807171IN

SUCCESS

Step 3

ask_user for CAPTCHA
User solves math captcha in UI

WAITING

Step 4

extract JSON result
Returns status and events

PENDING

Live Browser

Live Chrome screenshot on every agent step.

Human Input

Yellow Streamlit prompt for CAPTCHA, OTP, login — agent waits until you submit.

How to Run

- Streamlit → Government Services → India Post → Scripted mode.

Technology Stack & Impact

Production-grade components chosen for reliability

Frontend **Streamlit multipage app**

Live step cards, screenshots, human-input prompts.

AI Brain **Claude Sonnet 4.6**

Multimodal planner with OpenAI-compatible fallback.

Browser **Playwright + Raw CDP**

Auto-wait selectors, vision clicks, network intercept.

Runtime **Python 3.9+ asyncio**

Background agent threads and Windows event loop fix.

Impact

- Replaces 8-15 manual portal clicks with one natural-language request.
- Safe OTP/payment gates; extends to any Indian gov or travel site.

Team — Bindas Code

Building accessible AI automation for Indian citizens

Brindha Manickavasakan

Team Lead · Bindas Code

Architecture	System design, orchestrator.py observe-plan-act loop, travel_runner threading.
AI Integration	planner.py prompts, Claude multimodal actions, OpenAI fallback, recovery logic.
Automation	scripted_flows.py, Playwright engine, IRCTC and gov portal integrations.
Frontend	Streamlit multipage UI, human-in-the-loop prompts, live step cards and screenshots.
DevOps	Deployment setup, smoke tests, documentation, and hackathon submission.
